# Capítulo 1

## May 2018

### 1.1 13

#### 1.1.1 Learning L<sup>A</sup>T<sub>E</sub>X

- Working folder: *path*

L<sup>A</sup>T<sub>E</sub>X is a high-quality typesetting system, available as free software, which allows to produce scientific or technical documents [?]. I am using L<sup>A</sup>T<sub>E</sub>X to create a Bioinformatics Lab Book. To compile my Lab Book, I can use command lines ([pdflatex](#) and [bibtex](#)). Afterwards I can visualise the produced *.pdf* file with evince or another reader. Alternatively, I can use a Latex editor, such as TexWorks (<https://www.tug.org/texworks/>), which allows me to write the code and control the *pdf* file in the same environment (Figure 1.1).

To compile the *.tex* file in the command line:

```
$pdflatex lab-book  
$bibtex lab-book  
$pdflatex lab-book  
$pdflatex lab-book
```

To visualise the *.pdf*:

```
$evince lab-book.pdf &
```

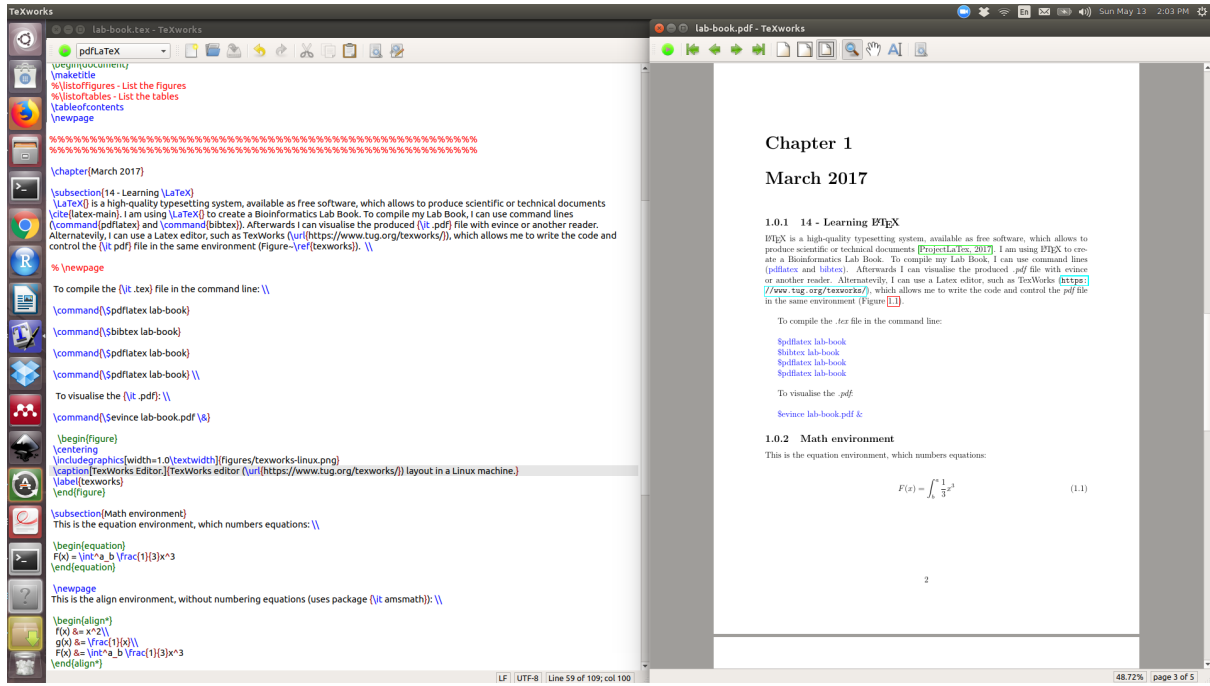

Figura 1.1: TexWorks editor (<https://www.tug.org/texworks/>) layout in a Linux machine.

## 1.1.2 Math environment

This is the equation environment, which numbers equations:

$$F(x) = \int_b^a \frac{1}{3} x^3 \quad (1.1)$$

This is the align environment, without numbering equations (uses package *amsmath*):

$$\begin{aligned} f(x) &= x^2 \\ g(x) &= \frac{1}{x} \\ F(x) &= \int_b^a \frac{1}{3} x^3 \end{aligned}$$

### 1.1.3 15 - Short-term project proposal

Some text here. Including and referencing a table (table 1.1).

- First numbered list item
- Second numbered list item

Tabela 1.1: table0

species	changes	score
Macaque	4	0.0
Human	2	14.9
Orangutan	0	0.0
Pan	0	0.0
Gorilla	0	0.0

# Capítulo 2

## Creation of data base of metagenomes and genomes

### 2.1 28

#### 2.1.1 Bibliographic search for genomes

Found a new possibility of phyla list. Because of this, there are four possibilities of list of microorganisms phyla, one of them, the SILVA database, is based in RNA sequences:

- The list of Prokariotic names with stading nomenclature <http://www.bacterio.net/-classifphyla.html>
- SILVA database LSU(large subunit of ribosome) <https://www.arb-silva.de/browser/lsu/>
- SILVA database SSU(small subunit of ribosome) <https://www.arb-silva.de/browser/ssu/>
- PATRIC GENOMES [https://www.patricbrc.org/view/Taxonomy/2#view\\_tab=taxontree](https://www.patricbrc.org/view/Taxonomy/2#view_tab=taxontree)

The list of articles used until now is:

- 10.1038/nature14486
- 10.1038/ismej.2013.111
- 10.1038/ismej.2013.174
- 10.1038/ismej.2016.43
- 10.1038/nature12352
- 10.1038/nature14486
- 10.1038/nature21031
- 10.1038/ismej.2015.233

- 10.1038/ncomms13219
- 10.1073/pnas.0801980105
- 10.1111/1462-2920.13362
- 10.1126/science.1132690
- 10.1186/s40168-015-0077-6

The list os correspondent phyla and articles is above

SRR2937354  
SRR2937355  
SRR2937356

Especie: *Platygyra carnosa* Healthy

I found other metagenomes of coral from article doi 10.3389/fmars.2018.00101 updated the file pmc\_results\_1.txt in the repository Lab\_book. I continue to look the articles in results. Estou atualizando a lista pmc\_results\_2.txt Na pesquisa bibliografica olhando o ttulo ja me faz perceber se devo descartar e olhar. E olho aqueles que marquei para olhar. Ao olhar, leio o resumo procurando por metodos. E vou para os metodos do artigo para checar. Checking the sizes of metagenomes files. The mg-rast metagenomes base have 72 Gb.

The pipeline of bioinformatic is different for MGRAST and NCBI. The size of NCBI should be superestimated, because the ncbi says the file size of sra file, but most of them is paired-end metagenomes, so when we apply fastq-dump, its generate two files fastq.

# Capítulo 3

## Download of metagenomes

### 3.1 Download of mg-rast files

Espao no SDU Disponvel para o ebiodiv: 10Tb Bia: 5Tb Rilquer: 2T Remanescente: 3Tb

- Working folder: *scratch/ebiodiv/leticia.cavalcante/mg\_rast*

I insert the list of metagenomes in the files before using it. After this, I used the following command line:

- Command: *nohup bash download\_curl\_mgrast\_corais.sh & download\_curl\_mgrast\_corais.nohupout &*

### 3.2 Download of NCBI metagenomes

I use the script *download\_sra\_wget\_corais.sh*, *libs* folder. I used the *wget*, because the *curl* is getting some problem in SDU. I noted that the size of the files is different:

Tabela 3.1: Comparing sizes of files

ID of metagenome	the size in NCBI site	size of file in SDU
SRR6785058	317.00 Mb	318M
SRR6785057	364.00 Mb	365M
SRR6785056	560.00 Mb	561M
SRR6785055	624.00 Mb	625M

So I checked the others files:

A Bia me informou que o SDU arredonda os valores de tamanho dos arquivos, entao at o momento nao tive problemas com o download dos arquivos do *mg\_rast*

Tabela 3.2: Comparing sizes of files 2

ID of metagenome	the size in NCBI site	size of file in SDU	size of cleaned file
mgm4440319.3.299.1	30M	29.1 MB	28M
mgm4440370.3.299.1	3,6M	3.5 MB	3,5M

mgm4694760.3.299.1	592M	1.6 GB	597M

## Capítulo 4

# Format Conversion of NCBI metagenomes

Adaptei o script da Bia para fazer a conversao do dos arquivos .sra  
Inicialmente submeti apenas um na cpu\_dev para testar:

Script: *teste\_slurm\_job\_fastq\_dump\_corais.sh*  
Numero do job: *220896*

Deu certo.

O Rilquer me ajudou a criar um script que cria jobs de anotacao com o kraken2 para cada dois metagenomas.

O nome do script 'creatijobfile.sh', ele unir dois scripts: 'header' e 'ending'

Adaptei para criar jobs do fastq-dump para cada 2 arquivos .sra, haja visto que no tenho uma boa ideia do quanto cada fastq-dump demorar.

Jobs submetidos dia 27/09/2018:

- job\_0.sh - job 221475
- job\_100.sh - job 221476
- job\_102.sh - job 221477

## Capítulo 5

# Adaptacao dos identificadores

Esse passo fez-se necessario nas anlises anteriores, pois quando eu fazia a limpeza, os arquivos de outputs que saiam eram apenas os singletons. The output files were named as SRAXXX\_good\_singletons\_1 and SRAXXX\_good\_singletons\_2 and there arent any other output files beyond these and the files with bad sequences. O Pablo fez a seguinte sugestão:

```
cat SRR1275409_pass_1.fastq | sed -r 's/(SRR1275409.[0-9]+)
.[0-9]+)/\1_left/' > SRR1275409_pass_1_corr.fastq
```

```
cat SRR1275409_pass_2.fastq | sed -r 's/(SRR1275409.[0-9]+)
.[0-9]+)/\1_right/' > SRR1275409_pass_2_corr.fastq
```

# Capítulo 6

## Quality filter

This step is only required for NCBI metagenomes. The command line was proposed by Bia:

- `trim_qual_left 25`
- `trim_qual_right 25`

# Capítulo 7

## Uniformity filter (size and N bases)

### 7.1 Command line

Parameters:

- `min_len` 80
- `ns_max_p` 2
- `out_format` 1

# Capítulo 8

## Profiling metagenomes

### 8.1 Mg-Rast metagenomes

I used the following script in the following folder:

- Folder: *scratch/ebiodiv/leticia.cavalcante/mg\_rast/filtered\_prinseq\_good*
- Command: *sbatch slurm\_job\_kraken2\_corais.sh*

The job doesn't work, o erro aparece na proxima figura

Ressubmeti o job, modificando a localizacao da DB do Kraken para a home do Rilquer.

Numero do job: 216410

Esse problema foi resolvido modificando o endereco da base para o scratch do Rilquer.

### 8.2 Kraken-biom

Pasta onde est instalado kraken-biom:

`/home/leticia/.local/bin`

Para executar: `python2.7 .kraken-biom`

Executar o help do kraken-biom:

`kraken-biom -h`

Abrir no vim o arquivo `.bashrc` e inserir:

`export PATH=$PATH:/home/leticia/.local/bin/kraken-biom`

Executar o help do kraken-biom:

`kraken-biom -h`

Eu fiz um teste da etapa "Creation of BIOM table of abundances" da pipeline da bia com os seguintes passos: Na pasta `/home/leticia/Documentos/libs/leticia.profiling_metagenomes`:

- `kraken-biom selected_file -o table.biom --max D --min P`
- `biom convert -i table.biom -o table.from_biom_with_taxonomy.txt --to-tsv --header-key taxonomy`

```

```

Figura 8.1: 2o erro no job no SDU

- `perl filterRank.pl input table.from_biom_with_taxonomy.txt --rank p & abundance.matrix`

## 8.3 Teste com o kraken no scratch

Linha de teste:

`perl selectGroups.pl input mgm4440370_prinseq_good_SiDP.fasta_kraken.report --file_groups groups.txt & selected_file`

```

- First Command: sbatch slurm_job_kraken2_corais.sh
- Second Command:
kraken2 -db /prj/ebiodiv/rilquer.silva/Serrapilheira
/Kraken2_custom_DB/ mgm4440370_prinseq_good_SiDP.fasta
-output mgm4440370_prinseq_good_SiDP.fasta_kraken.profiled
-use-names -report mgm4440370_prinseq_good_SiDP.fasta_kraken.report

```

Ja testei o comando acima na home do SDU e agora no scratch

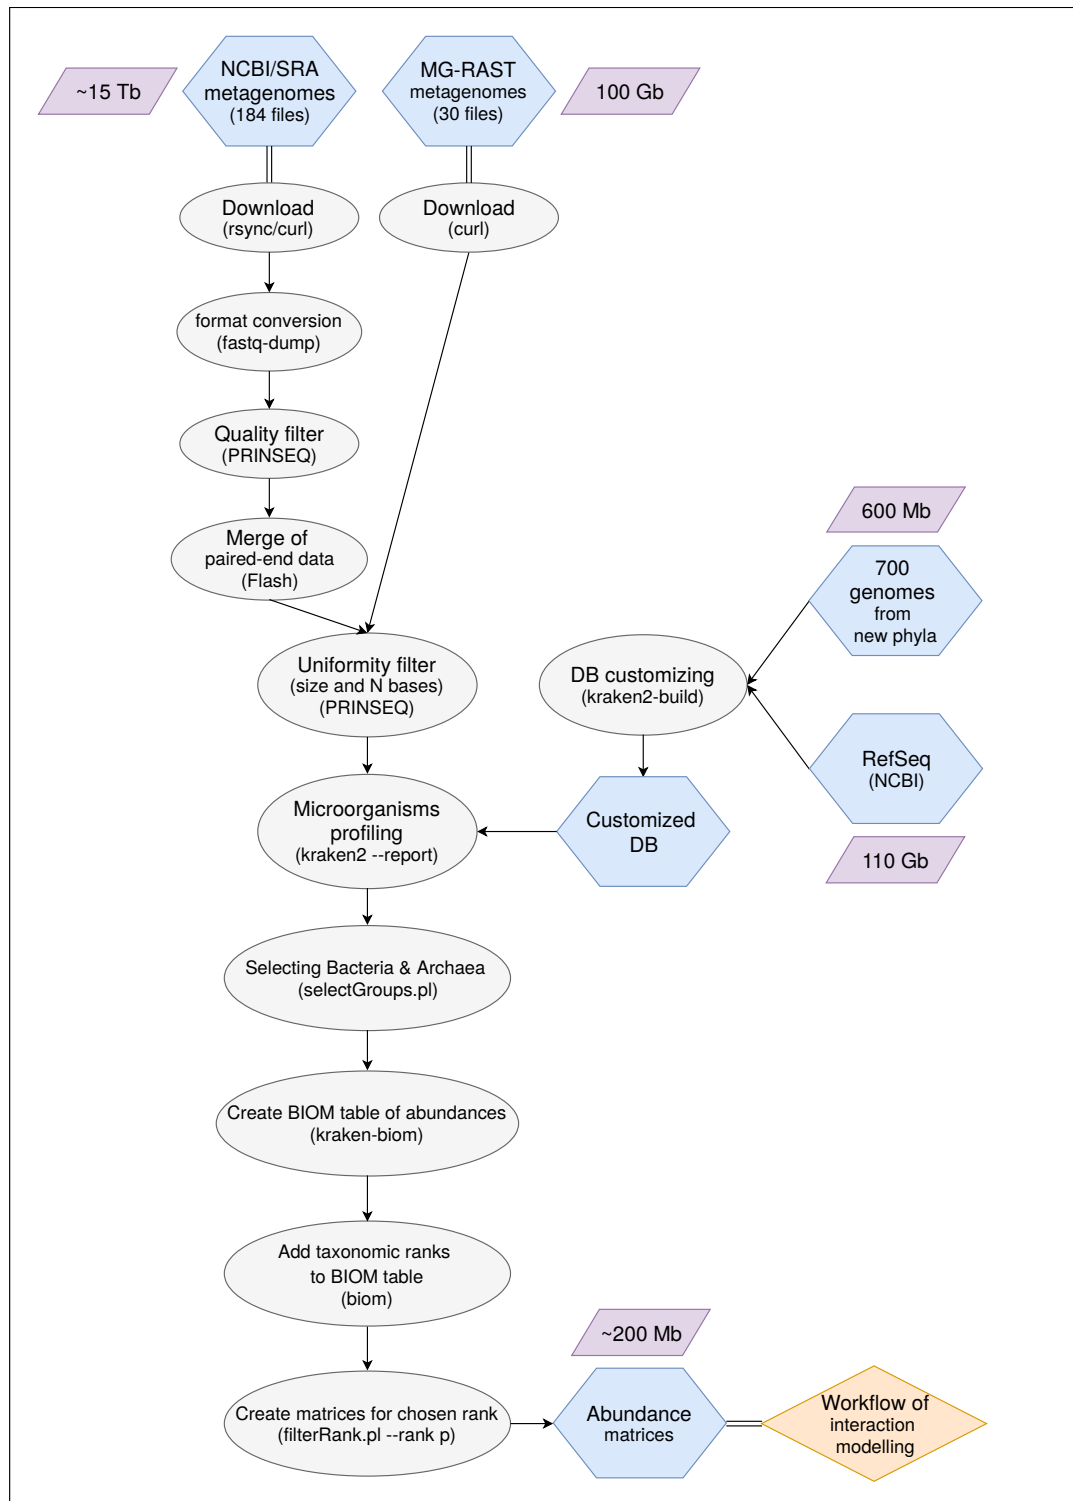

Figura 8.2: Pipeline of taxonomic annotation

## 8.4 Profiling no Atlantico com a ajuda do Rilquer

O Rilquer fez um script que automatiza o processo, em que a limpeza e anotacao ocorrem simultaneamente. Fiz um teste com esse script para um metagenoma com a seguinte linha:

```
- Comand: taxonprofiling -s mgm4440378.3.299.1 -f MGRAST -k /home/pedro/-  
Kraken2_custom_DB  
- Script: taxonprofiling  
- Folder: /fsprofpedro/holobionts/mgrast  
- Para chamar o script: taxonprofiling
```

Sairam 4 outputs:

- *mgm4440378\_kraken.class*
- *mgm4440378\_kraken.output*
- *mgm4440378\_kraken.report*
- *mgm4440378\_kraken.unclass*

De acordo com a pipeline da Bia, o arquivo a ser usado e o report. Teste a seguir com a pasta com os metagenomas do mg-rast inteiro:

```
-Comand: taxonprofiling -d /fsprofpedro/holobionts/mgrast -f MGRAST -k /home/-  
pedro/Kraken2_custom_DB  
- Folder: /fsprofpedro/holobionts
```

No email do Rilquer, vi que tenho que submeter o job para uma fila que no tem acesso ao fsprofpedro. Ento criei uma pasta temporaria chamada mgrast\_temp, no home/pedro

```
- Job: profiling_metagenomes_corais_mgrast.sh  
- Folder temporario em que as amostras foram copiadas: /home/pedro/m-  
grast_temp  
-Folder de submissao: /home/pedro/
```

Na pasta /fsprofpedro/holobionts, tem um exemplo de job chamado jobexample. Submissao:

```
-Folder de submissao: /home/pedro/mgrast_temp  
- Numero: 122283.atlantico  
- Command: qsub profiling_metagenomes_corais_mgrast.sh
```

## 8.5 Analises e obtencao de figuras

Apliquei o tutorial do professor para obtencao de figuras no R para visualizacao dos resultados.

- Script: *analisis.R*
- Folder: */home/leticia/Documentos/libs/R*

Figuras obtidas:

Figura 8.3: Anlise de componentes principais com todos os filos como variaveis

Na analise acima, as variaveis so muitas e ficam muito sobrepostas, fazendo com que haja grande poluicao visual. O professor recomendou em marco a utilizar uma analise de Random Forest, para que as variaveis mais importantes para os metagenomas que trabalho sejam ranqueadas. O random forest um algoritmo de machine learning que, a partir das duas categorias de sade (categorias de supervisao), elencar as variveis mais importantes para classificar as amostras nesses dois estados. o random forest abaixo su-

pervisionado por estado de sade

Figura 8.4: Random Forest ranqueando filotaxas

Eu utilizei os 20 primeiros filotaxas ranqueados para fazer o PCA. Segue esse PCA abaixo:

Figura 8.5: PCA com 20 filotaxas utilizados no PCA

Uma tendencia se manteve: foi a separao das amostras por genero. Mas a poluicao visual ainda continuou, por isso fiz um random forest com os 15 primeiros filis indicados pelo random forest. Segue abaixo:

Figura 8.6: PCA com 15 filis como variaveis

Algumas tendencias tambem se mantiveram e a explicao dos eixos melhorou levemente. As amostras agrupadas no quadrante direito superior so mais diferentes das que esto no quadrante esquerdo do que das que esto no quadrante inferior direito. Na reuniao feita no dia 03/10/2018, o Amaro, o professor e Miguel me sinalizaram que existe uma separacao forte entre generos, indicando que os grupos candidatos podem ser genero - especificos. Surgiu a sugesto de leitura de textos em core microbiome e especificidade de filis entre generos e o professor sugeriu fazer um random forest nao supervisionado que segue abaixo. O professor Garcia no congresso sugeriu utilizar os auto valores do PCA para ver quais podem ser mais relevantes (?).

Figura 8.7: Random Forest nao supervisionado

Fiz um pca (libs/R/analysys.R) a partir dos primeiros 15 filis indicados no Random Forest nao supervisionado acima. Segue abaixo:

Figura 8.8: PCA a partir dos 20 filis primeiros filis que aparecem acima no random forest

Note: This article has a important information about microbial ecology: "Network and modeling analyses aim to disentangle the strength and nature (positive, negative, or neutral) of the interactions and predict their dynamics. Bacteria-bacteria network analysis of the core microbiota in different sponge species has revealed a low connective network with very few strong and many weak unidirectional interactions (i.e., amensalism [/0] and commensalism [+ /0] prevailed over cooperation [+ /+] and competition [/]. These findings are consistent with mathematical models that predict that weak and non-cooperative interactions help to stabilize highly diverse microbial communities, whereas cooperation yields instability in the long term by fueling positive feedbacks"
